Checking objective test

Your task is implementing a program which receives two inputs. The first one is the objective test correct answer, and the second one is a student's answers, for example,

- The correct answer is AAABC means A, A, A, B and C for the first to the fifth problem.
- Student's answer AABCC means A, A, B, C and C for the first to the fifth problem answer for this student.
- The student answers correctly for 3 problems.

Input

The first line is the correct answer string. The second line is a student answer string.

Output

Number of correct answers. If the number of the first line does not equal to the second one, the screen displays **Incomplete answer**.

Example

Input (from keyboard)	Output (on screen)
AAABC AABCC	3
AAAAAAAAAAAAAAAAAAAA BBBXXBBBBB BBBBB BBBBBB	0
AAAAAAAAAAAAAAAAAAAAAA AAAAAAAAAAAAA	Incomplete answer
